

# Descriptive report of DB050

## Description

**Short Description:** Stratum

**Long Description:** This variable reports on the primary stratum corresponding to each observation unit (individual or household) in cases where the target population is stratified at the first stage of sample design. It provides identification codes for the different strata. The information collected is sampling information needed to calculate measures of spread (like variance and standard deviation) and to observe changes over time. It specifically collects information about the primary strata used in selecting the sample.
