

Descriptive report of DB060

Description

Short Description: Primary sampling units [PSU]

Long Description: This variable measures the Primary Sampling Units (PSUs) used in selecting the sample. It reports on the PSU corresponding to each observation unit (individual or household) when the target population is divided into clusters. It provides identification codes for these clusters or PSUs. The information collected is sampling data needed to calculate measures of spread (e.g., variance and standard deviation) and to observe changes over time. Multi-stage sampling involves dividing the population into PSUs at the first stage, which is done when direct-element sampling is impossible or too expensive.
